

UNBEATABLE! THE NEW IF-139

- Very good adhesion of coating systems
- Takes stain
- Very long shelf-life
- Extremely good adhesion

Ideal for the Filling of Knotholes, Wood Cracks, Open Joints and Drill Holes in Production

Get to know the new talent from company König: The new filler for the ideal removal of flaws in industrial production. To be used on solid wood and veneer, wooden composite, chipboards, MDF and plastic materials.

The new Industrial Filler from König is optimally adapted to the requirements in the production process. It impresses with its **rapid melting phase** and a very **short cooling time**. Further advantages are the **low processing temperatures**, the **high density** and the **strong compound** the filler forms with different materials. Furthermore, a **super matte finish** is achieved which normally is hardly possible to achieve. After application, the filler, of course, can be further processed and even varnished. For example, **mechanical sanding, cutting, planing, milling, brushing and drilling** as well as **varnishing with NC lacquer, 2C lacquer, waterbased lacquer or UV lacquer** is possible. Even staining and waxing as well as subsequent oiling is possible. Last but not least, the filler does not have an unpleasant odour and of course is resistant against heat, cold and moisture and thus also **suitable for outdoor use**.

The Industrial Filler from König is available as **melt sticks** of 11 mm diameter and approx. 30 cm length. At the moment five different colours are available: Light brown, dark brown and black. We endeavour to offer our customers special colour matches as usual.

On our website www.heinrich-koenig.de we provide additional information like Technical Data Sheet and Safety Data Sheet.

Melt sticks – Get to know the new Industrial Filler: Filling quickly and sustainably open joints, knotholes, wood cracks and much more during production process.
